

# Who can administer

Administration RESTRICTED - see Appendix 1

# Important information

- Contraindicated in patients with known or suspected prolonged QT interval
- Avoid use with medications which also cause QTc prolongation examples include: macrolide antibiotics (e.g. clarithromycin), fluoroquinolone antibiotics (eg ciprofloxacin), antihistamines, certain anti-arryhythmics, methadone, pentamidine
- Cardiovascular monitoring required (see monitoring requirements below)

### Available preparations

Droperidol (Panpharma) 2.5mg per 1mL ampoule (unlicensed)

## Reconstitution

Already in solution

#### Draw up using a 5 micron filter needle

#### Methods of intravenous administration

#### Slow intravenous injection

• Administer over at least 3 minutes (ref 1)

## Dose in adults

#### Prevention and treatment of post-operative nausea and vomiting (PONV)

- Adults: 0.625 to 1.25mg (see also further information)
- Elderly: maximum 0.625mg
- Renal/hepatic impairment: maximum 0.625mg (caution advised in renal and hepatic impairment)
- Administration of droperidol is recommended 30 minutes before the anticipated end of surgery
- Repeat doses may be given every 6 hours as required

## Monitoring

- Continuous pulse oximetry should be performed in patients with known or suspected risk of ventricular arrhythmia and should continue for 30 minutes following single intravenous administration (ref 1)
- Monitor blood pressure and heart rate  $^{\mbox{\tiny (ref 1)}}$

# Further information

• The manufacturers suggest that droperidol may be added to PCA. However, this is not practice within GUH. See SPC for further details

## Storage

Store below  $25^{\circ}C$
